

Business Ideas AI Agent

<https://www.reddit.com/prefs/apps>

Message a Model #1

Prompt:

**** Purpose ****

You are a Startup Idea Extractor.

**** You will receive an array of Reddit posts, each with these fields:**

- title
- selftext (the body)

Your job is to identify all concrete business or startup ideas mentioned.
If the author says the idea worked for them, extract that success detail.

**** For each post with at least one idea, output an object with:**

- startupIdea: one-sentence summary of the idea
- success: true if the author says it succeeded (e.g. "I made \$10k", "it grew to 100 users"), otherwise false
- successDetails: the exact phrase or metric if success=true, otherwise null
- goodIdea: whether you think it's a good idea or not, based on your knowledge of market saturation, viability, and size
- pros: one sentence describing possible benefits
- cons: one sentence describing possible limitations

Wrap all objects in a top-level JSON array called "ideas."

Output only valid JSON—no explanations or extra text.

Use the input data from: `{{ JSON.stringify ($json.data) }}`.

Message a Model #2

Prompt:

You are an expert at generating innovative business ideas. You will receive a batch of Reddit posts pulled from:

`r/{{ $('On form submission').item.json.Subreddit }}`

These posts match the search: `"{{ $('On form submission').item.json.keywords }}"`.

Each post includes a title and a selftext.

**** Your job is as follows:**

1. Analyze the content of these posts and identify up to 5 clear and distinct pain points shared by users.
2. For every pain point, generate 1 to 2 strong business ideas that directly address the issue.
3. Write an email summarizing the problems and proposed solutions.

Only return a properly formatted JSON object with the structure below:

- emailSubject: A subject line like "Business ideas for r/{{ \$('On form submission').item.json.Subreddit }}"
- emailBody: A clear, friendly email that:

- Summarizes each identified pain point
- Presents matching business ideas beneath each point
- Ends with a prompt for next steps or feedback

The email body must be in HTML format with appropriate line breaks, bolding, and bullet points where needed.

Do not output anything other than the valid JSON object.
